Final Project Proposal

Name of Mobile APP	SS4U(Stress Solutions For You)	**Name of Global Team**	Handa
Names of Korean Students	Teaeun Kim Seohyeon Lee	**Names of International Students**	Mahir Daiyan Safwaan Muhtasim Zaman Mahim
Related SDGs	SDG#3 Health and Well-Being	**Related School Subject**	e.g., Social Studies, Math, Science
Target Education Level	□ PRIMARY ■ JUNIOR SECONDARY ■ SENIOR SECONDARY	**Target Country**	International

□ Overview

Please describe your motivation to develop App and define situation or problems related to the theme you have thought with idea or direction to solve them.

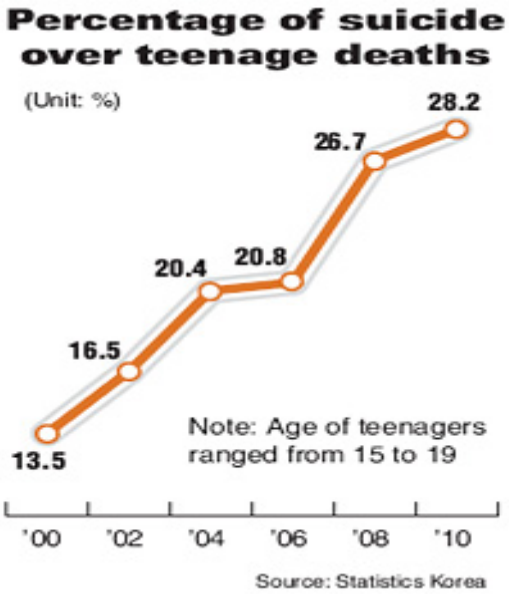

Content	**Images (if necessary)**
✓ According to a survey of youth stress and depression, 3.5 out of 10 high school students feel normal stress, and 2.5 out of 10 experienced a depression within a year. ✓ As such, more teenagers are stressed than expected, and even commit suicide. So, we focused on mental health of adolescent among three types of health in SDG#3 and we accept the seriousness of the problem and are trying to lower the stress levels of adolescents through the apps we create.	

□ Solutions

Please describe what you have found to solve problems defined above or other relevant problems with the originality of your App to be developed through this.

Content	**Images (if necessary)**

We think it's very important to give opportunity to students that they can recognize their degree of stress or stress level exactly and they can get their own solutions against their stress because many students mind going to receive counsel and they can't get chances to receive professional help with experts about stress.
Also this problem about adolescent's stress causes a lot of secondary problems in our social. Yearly, youth suicide and adolescent's obsession with game that is occurred by their stress is increasing. Especially, the academic stress of adolescent with their low grades or test scores is also severe problem. Many students include our friends and we are stressed out also, experience depression by big burden on test and a lot of expectations from our parents.
We want to decrease adolescent's stress and solve our social problems by useful app, SS4U.
Our ultimate purpose with SS4U is that inform degree of stress of plater and change distress that means bad stress and causes health problems into eustress that means good stress and give motivation to us.

□ Design of App

Please describe your idea of developing App and organize data that you need to develop, why it needs, how to utilize and how to get them. Design main functions and UI(Screen of App) of your App.

Content

●App process

There are three main steps of app process.

1. Measure your stress

There are many questions that analyze your stress. The result of measurement shows your stress stage among three stress stages.

2. Decide your avatar

Avatar is decided depend on the result of measurement. Avatar has a specific shape that inform your degree of stress.

3. Suggest stress solutions

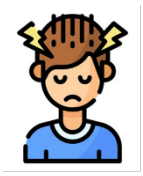

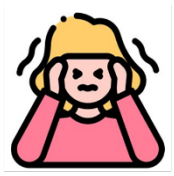

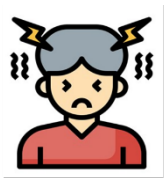

The number of level is decided depend on the stages of stress. The levels suggest different solutions suitable for the player. According to level, player should try to reduce stress of avatar.

●Data that we need to develop

At first, we need some questions that player can measure their exact stress level. We need different pictures of avatar according to the stress stages and various solutions to solve the stress according to many levels. We will get questions of measurement with from expert(psychologist) and we can use the site https://www.teenstress.co.kr/ to get many information about stress and appropriate solutions.

●Main functions of SS4U

Our first main function is the avatar. There are three types of avatars in this app, each with a specific round shape. We relieve the stress of this avatar also relieve the stress of the player. This app has a player's avatar so it can give interests, accomplishments to many players and also amplify the stress- relieving effects.

Our second main function is level part. Each stage has levels (alarm stage has 3 levels, resistance stage has 4 levels, and exhaustion stage has 5 levels), and each level has a mission(solution). When player do the mission(solution) the specific round shape will be change. When it disappears (avatar's stress become zero) player can do other stages. So player can release stress by repeating this method.

□ Visualization of App (optional)

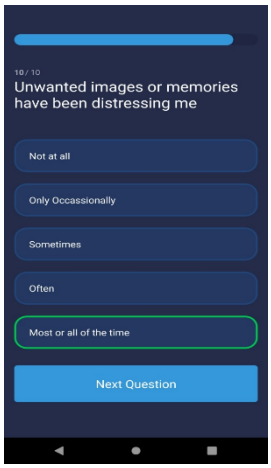

Please explain UI, main functions and motion process of your App.

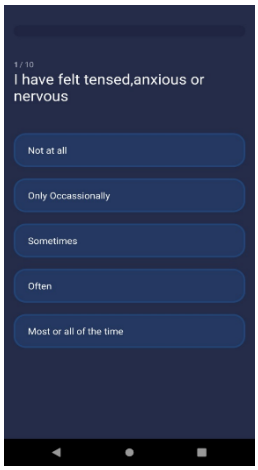

Content with Images (prototype of UI)

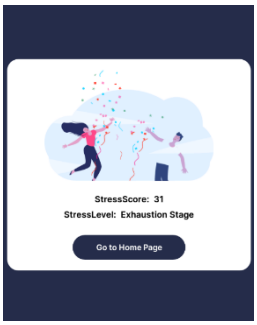

●Quiz part

In quiz part, player can measure their stress with many questions.

The top of the screen shows the progress in quiz part and there are many answer options that player can select. After player select one answer among 4 options, player can pass to the next question. When player answer all of the questions, there is a screen with message that inform stress score and stress level.

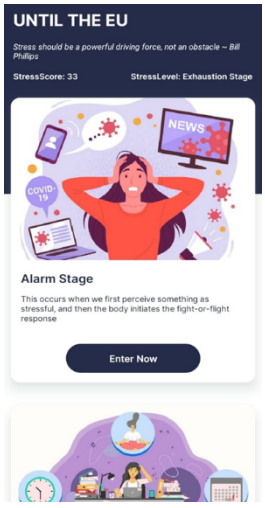

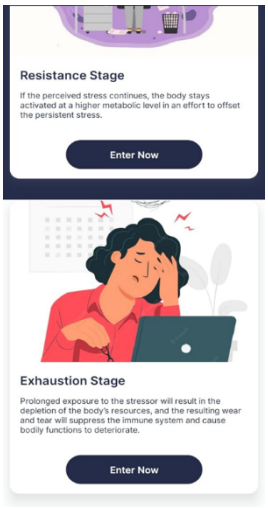

●Second UI

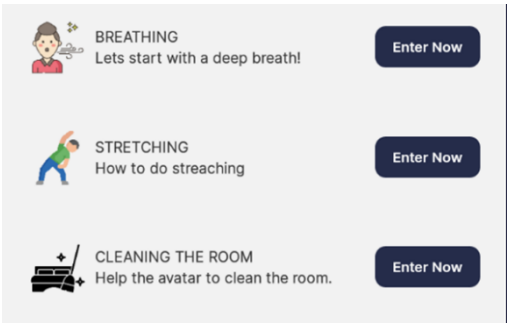

There are three stages of stress: the alarm stage, the resistance stage, the exhaustion stage. There is stress level at the top of the second UI. So, player can remind their stress stage again. When player click on 'Enter Now' in player's own stress stage, there is description about the stage and levels according to the stage.

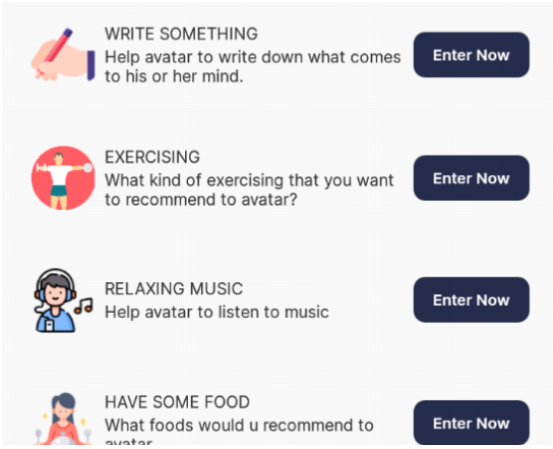

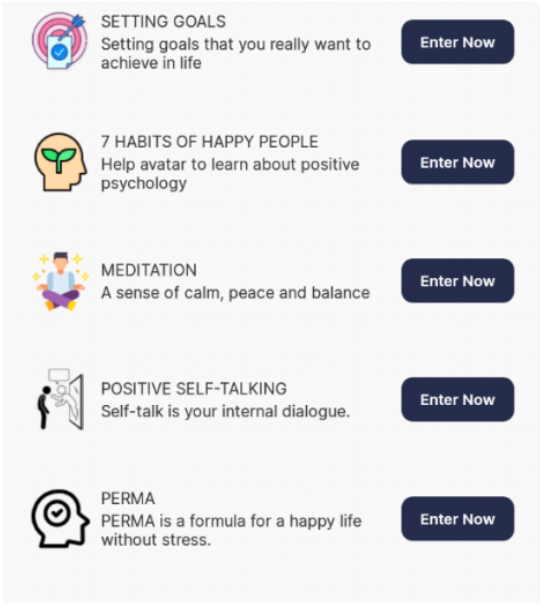

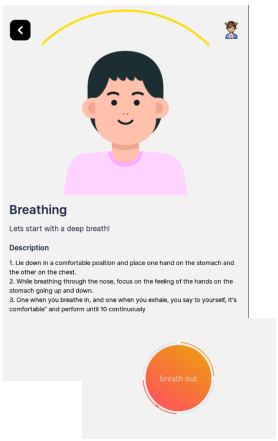

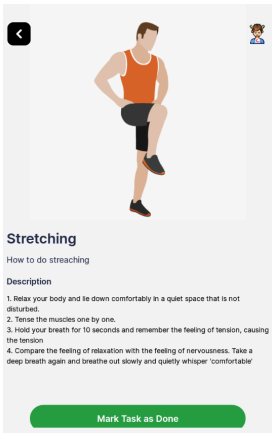

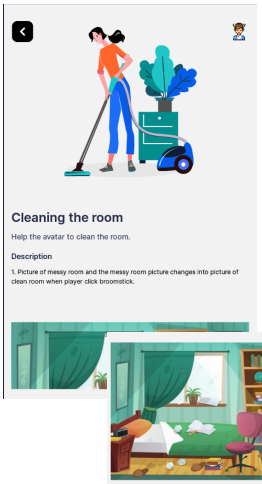

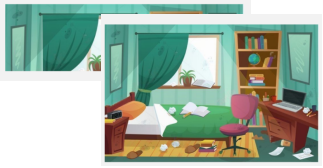

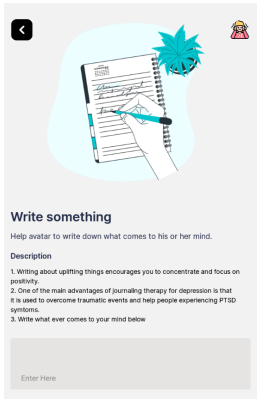

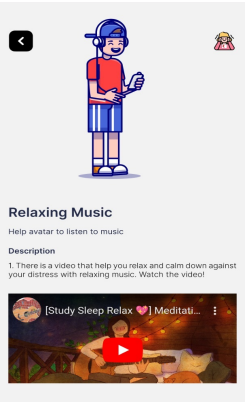

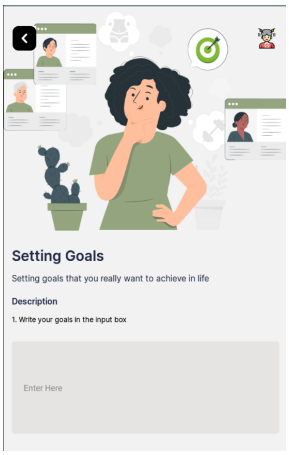

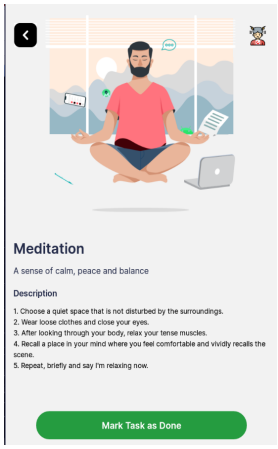

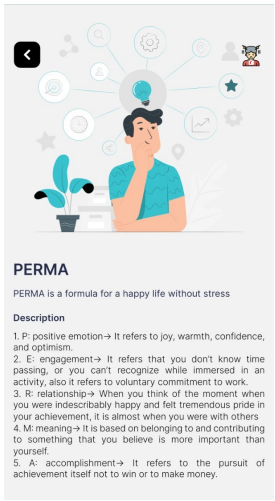

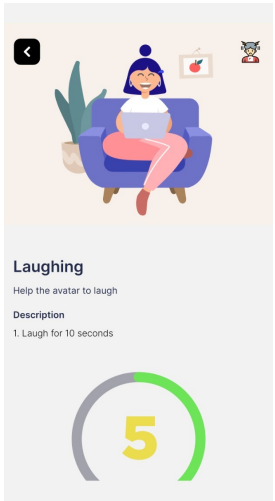

The alarm stage:

1. Breathing
2. Stretching
3. Cleaning room

The resistance stage: 1. Writing something 2. Exercising 3. Relaxing music 4. Have some food	
The exhaustion stage: 1. Setting goals 2. 7 habits for happy people 3. Meditation 4. Laughing 5. PERMA	
●Level part When player click on 'Enter Now' in each level, player can come into the level. There are description and avatar that is located at the bottom in level. In description, there is solution about stress(misson that player should do) and hints that player can get to pass the level. <Missons/hints> The alarm stage	

Level 1/3- 'Help avatar to do breathing out slowly'/explanation about how to do breathing. Level 2/3- 'Help avatar to do stretching'/ picture of yoga mat and explanation about how to do stretching. Level 3/3- 'Help avatar to clean his/her room'/picture of messy room and the messy room picture changes into picture of clean room when player click.	   
The resistance stage Level 1/4-'Help avatar to write down what comes to his or her mind'/questions and answer boxes. Level 2/4-'What kind of exercising that you want to recommend to avatar?'/there are many kinds of exercise and each exercise has explanation. Level 3/4-'Help avatar to listen to music'/ the video that helps to relieve stress with music. Level 4/4-'What foods would you recommend to an avatar?'/there are many kinds of food that are helpful or harmful to stress and each food has explanation.	   

The exhaustion stage Level 1/5-'Setting goals that you really want to achieve in life'/answer box Level 2/5-'Habits for happy life'/there are 7 habits of happy people. Level 3/6-'How to do meditation?'/there are two ways(options) of meditation and explanations. Level 4/6-'Benefits of positive self talking'/eight benefits. Level 5/6-'PERMA'/there is explanation of 'perma'. Level 6/6-'Laughing'/there is a timer that player should spend their time to laugh for 10 seconds. ●Back to the home.	     

□ Results and Value

Please describe results of sharing App with other friends and its value. If you don't have visulalization, describe value of solving problems or App development.

Content	Images (if necessary)

In the beginning of making app, we experienced communication problems, so we had some misunderstanding parts with creating SS4U. However, we met and discussed about many creative ideas frequently, and we could start making app systematically also we divided our roles into coding part and creating ideas and we did our best to perform each role. It was pretty hard to implement our all ideas in the process of creating apps, but at that time, we gathered together and discussed new solutions by using 'google meet' and the message program, 'whatsapp'. to problems that we faced. We all surprised by the fact that we made one great app ourselves and we felt a tremendous sense of accomplishment. It would be very good experience because, while creating an app, we knew the power of cooperation also we became good friends to each other. While preparing to create this app, we realized the seriousness of the youth stress problem even more deeply, and we could reduce our stress by looking for and following the stress-relieving methods that we would actually use for the app.

We hope that by our app, SS4U, many students and players can decrease their stress and find their own stress-relieving ways.

□ Utilization Plan and Points to be Desired

Please describe what you want the App to be utilized in various sections like society, economy, education with some points to be desired or modified.

Content	Images (if necessary)

In society..

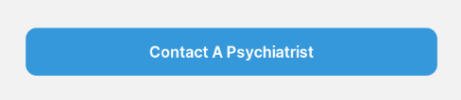

1. Prevent students' health problem and addiction on game, so it can also prevent a lot of social problems.
2. Form healthy youth social culture.

In education…

1. Students can recognize their stress levels and they can find out their own solutions to stress.
2. Students can reduce their stress in a more interesting and effective way by using avatars.

When SS4U is commercialized in our society, we want to add more things or functions in our app.

1. In level part, there are many levels than now and we want to make mini games that player can do something(misson) to avatar to pass the level.
2. We want to give solutions continuously to player when the player is stressed out. So, when stress of avatar becomes zero, measure player stress again.
    1) If player stress is zero, measure stress once in two weeks.
    2) If player stress is better than before, reduce level according to degree of improvement.
    3) If player stress is worse than before, increase level according to degree of deterioration.
3. We want to add some functions to this button.

-It's our plan for the future. When a user clicks on the button he/she can directly contact with a psychiatrist. The user can consult with the doctor directly though this app.
